HOME

This presentation's goal is the following:

- 1- teach you the basics of Unreal Engine 5 blueprint
- 2- show you the use cases
- 3- help you begin in creating a game from scratch

[Learn More](#)

UNREAL ENGINE 5

Unreal Engine is built by developers, for developers, with fair terms for all. Because everyone with an idea deserves to use the world's most open, advanced real-time creation tool to bring it to life.

Game Presentation

BLUEPRINT

- The Blueprint Visual Scripting system in Unreal Engine is a visual programming language that uses a node-based interface to create gameplay elements. The node-based workflow provides designers with a wide range of scripting concepts and tools that are generally only available to programmers. In addition, Blueprint-specific markup available in Unreal Engine's C++ implementation provides programmers with a way to create baseline systems that designers can extend.

I personally use blueprint when i am coding or creating a game due to its ease of use and ability to roadmap the creation of your game.

BLUEPRINT

How Do Blueprints Work?

Blueprints work by using graphs of nodes for various purposes, such as object construction, individual functions, and general gameplay events. You can create gameplay elements by connecting nodes of events, functions, and variables with wires.

Types of Blueprints

- 1- Level Blueprint
- 2- Blueprint Class
- 3- Data only class
- 4- Blueprint interface
- 5- Macro Library

BLUEPRINT: LEVEL BLUEPRINT

A Level Blueprint is a specialized type of Blueprint that acts as a level-wide global event graph. Each level in your project has its own Level Blueprint created by default that can be edited within the Unreal Editor, however new Level Blueprints cannot be created through the editor interface.

BLUEPRINT CLASS

- an asset that allows content creators to easily add
 - functionality on top of existing gameplay classes.
- Blueprints are created inside of Unreal Editor visually, instead of by typing code, and saved as assets in a content package. These essentially define a new class or type of Actor which can then be placed into maps as instances that behave like any other type of Actor.

contains only the code (in the form of node graphs), variables, and components inherited from its parent. These allow those inherited properties to be tweaked and modified, but no new elements can be added. These are essentially a replacement for archetypes and can be used to allow designers to tweak properties or set items with variations.

Data-Only Blueprint are edited in a compact property editor, but can also be "converted" to full Blueprints by simply adding code, variables, or components using the full Blueprint Editor.

DATA ONLY CLASSES

BLUEPRINT INTERFACE

Interfaces

- Blueprint Interfaces can be made by content creators through the editor in a similar fashion to other Blueprints, but they come with certain limitations in that they cannot:
 - Add new variables
 - Edit graphs
 - Add Components

MACTO LIBRARY

A Blueprint Macro Library is a container that holds a collection of Macros or self-contained graphs that can be placed as nodes in other Blueprints. These can be time-savers as they can store commonly used sequences of nodes complete with inputs and outputs for both execution and data transfer.

Macros are shared among all graphs that reference them, but they are auto-expanded into graphs as if they were a collapsed node during compiling. This means that Blueprint Macro Libraries do not need to be compiled. However, changes to a Macro are only reflected in graphs that reference that Macro when the Blueprint containing those graphs is recompiled.
